EC 380: Lecture 7

Trade Policy: Tariffs, Quotas and Subsidies

Philip Economides Winter 2023

Prologue

Previously

• Trade openness appears to have had an affect on the compositional make-up of US industrial activity

Previously

- Trade openness appears to have had an affect on the compositional make-up of US industrial activity
- Effects are likely negative for low income unskilled workers

Previously

- Trade openness appears to have had an affect on the compositional make-up of US industrial activity
- Effects are likely negative for low income unskilled workers
- Migration openness yields little evidence of wage change

Today

Effects of protectionism through tariff rates and quotas

Previously

- Trade openness appears to have had an affect on the compositional make-up of US industrial activity
- Effects are likely negative for low income unskilled workers
- Migration openness yields little evidence of wage change

Today

- Effects of protectionism through tariff rates and quotas
- Inform ourselves on how interference with free trade impacts market

We'll work through **five topics**, as per IE:

• Use market theory to explain **effects of tariffs** on market outcomes

- Use market theory to explain **effects of tariffs** on market outcomes
- Compare tariff data on inputs and outputs to compare effective and nominal protection levels

- Use market theory to explain **effects of tariffs** on market outcomes
- Compare tariff data on inputs and outputs to compare effective and nominal protection levels
- Comparing the **impact of quotas** relative to tariff rate adjustments

- Use market theory to explain **effects of tariffs** on market outcomes
- Compare tariff data on inputs and outputs to compare effective and nominal protection levels
- Comparing the **impact of quotas** relative to tariff rate adjustments
- Highlight forms of protection difficult to observe

- Use market theory to explain effects of tariffs on market outcomes
- Compare tariff data on inputs and outputs to compare effective and nominal protection levels
- Comparing the **impact of quotas** relative to tariff rate adjustments
- Highlight forms of protection difficult to observe
- New unconventional methods of protectionism

Below I define key terms for this session:

Below I define key terms for this session:

• **Protectionism**: A concerted effort to shield domestic industries from external competitive pressure by restricting foreign import choices. This can be achieved through subsidizing local industry, taxing imports and limiting number of goods that can enter the country, per annum.

Below I define key terms for this session:

- **Protectionism**: A concerted effort to shield domestic industries from external competitive pressure by restricting foreign import choices. This can be achieved through subsidizing local industry, taxing imports and limiting number of goods that can enter the country, per annum.
- Tariff: Percentage of value based tax on a country's imports. These vary based on the origin and commodity of imported goods.

Below I define key terms for this session:

- **Protectionism**: A concerted effort to shield domestic industries from external competitive pressure by restricting foreign import choices. This can be achieved through subsidizing local industry, taxing imports and limiting number of goods that can enter the country, per annum.
- Tariff: Percentage of value based tax on a country's imports. These vary based on the origin and commodity of imported goods.
- **Quota**: Weight and quantity limits on the amount of goods that can be imported into the country

Below I define key terms for this session:

- **Protectionism**: A concerted effort to shield domestic industries from external competitive pressure by restricting foreign import choices. This can be achieved through subsidizing local industry, taxing imports and limiting number of goods that can enter the country, per annum.
- Tariff: Percentage of value based tax on a country's imports. These vary based on the origin and commodity of imported goods.
- Quota: Weight and quantity limits on the amount of goods that can be imported into the country

Not all quotas are acts of protectionism. Some are required for national security (e.g. protecting the domestic supply of food), or to avoid health concerns related to imports from specific countries (e.g. livestock diseases)

Thus far we have examined transitions from **autarky** into **free trade**.

Thus far we have examined transitions from autarky into free trade.

In practice, even the most seemingly open economies will have some kind of measures in place that regulate the manner in which goods are traded internationally.

Thus far we have examined transitions from autarky into free trade.

In practice, even the most seemingly open economies will have some kind of measures in place that regulate the manner in which goods are traded internationally.

Restrictions introduce quality control over goods entering Home, but have added effect of **limiting volume of trade** that would otherwise occur.

Thus far we have examined transitions from autarky into free trade.

In practice, even the most seemingly open economies will have some kind of measures in place that regulate the manner in which goods are traded internationally.

Restrictions introduce quality control over goods entering Home, but have added effect of **limiting volume of trade** that would otherwise occur.

Why? Trade policy, like any other form of intervention, introduces **costs for firms**, which get passed on to consumers. Some will **switch to domestic goods**.

Consumer Demand Curve

Consumer Demand Curve

- Demand is mapped by the marginal willingness of individuals to pay for a good at a given price
- At a particularly high price, only a small number of individuals would purchase
- As price falls, the good enters into a greater pool of individuals'
 marginal willingness to pay, leading to quantity demanded rising

Therefore, we assume a **negative relationship** between market price and quantity demanded

Producer Supply Curve

Producer Supply Curve

• When the market price is particularly low, only a small number of firms can afford to service the market

Producer Supply Curve

- When the market price is particularly low, only a small number of firms can afford to service the market
- As **price rises**, the **quantity supplied to the market increases**, given that the greater associated revenue makes business profitable for an increasing number of firms.

Producer Supply Curve

- When the market price is particularly low, only a small number of firms can afford to service the market
- As **price rises**, the **quantity supplied to the market increases**, given that the greater associated revenue makes business profitable for an increasing number of firms.

Therefore, we assume a **positive relationship** between market price and quantity supplied

Consumer and Producer Surplus

Consumer and Producer Surplus

Combining these two strands of intuition:

Consumer and Producer Surplus

Combining these two strands of intuition:

Demand curve for a given good is downward sloping

Consumer and Producer Surplus

Combining these two strands of intuition:

- Demand curve for a given good is downward sloping
- Supply curve for a given good is upward sloping

Consumer and Producer Surplus

Combining these two strands of intuition:

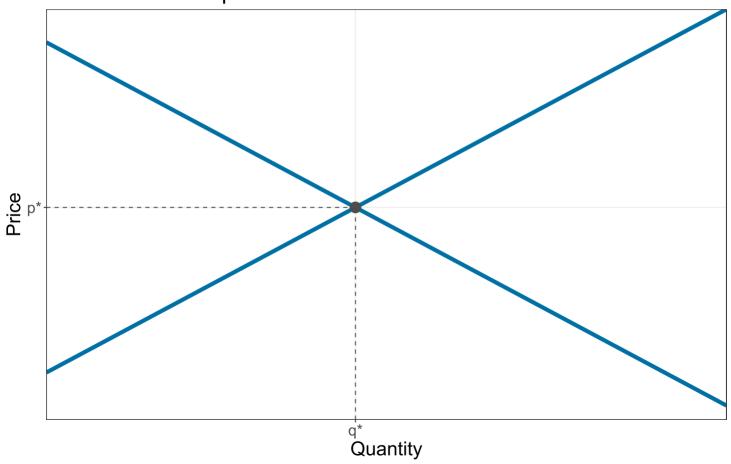

- Demand curve for a given good is downward sloping
- Supply curve for a given good is upward sloping

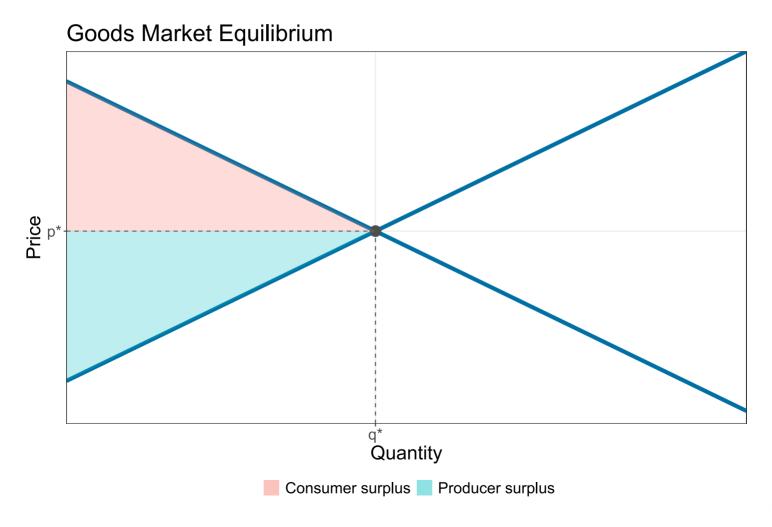

As per standard econ: market produces where supply meets demand.

Any difference between marginal willingness to pay and price represents surplus for the consumer. Similarly the case for producers.

Consumer and Producer Surplus

Consumer and Producer Surplus

To calculate the area of **consumer surplus**:

$$ext{CS} = rac{1}{2} imes ext{[Demand}(q=0) - \ p^* \ ext{]} imes q_d^*$$

Consumer and Producer Surplus

To calculate the area of **consumer surplus**:

$$ext{CS} = rac{1}{2} imes ext{[Demand}(q=0) - \ p^* \ ext{]} imes q_d^*$$

To calculate the area of **producer surplus**:

$$ext{PS} = rac{1}{2} imes \left[\ p^* - ext{Supply}(q=0) \
ight] imes q_s^* \, .$$

Consumer and Producer Surplus

To calculate the area of **consumer surplus**:

$$ext{CS} = rac{1}{2} imes ext{[Demand}(q=0) - \ p^* \ ext{]} imes q_d^*$$

To calculate the area of **producer surplus**:

$$ext{PS} = rac{1}{2} imes \left[\ p^* - ext{Supply}(q=0) \
ight] imes q_s^* \, .$$

We are simply calculating the areas of the triangles for our measures of CS and PS in this free-market scenario.

Consumer and Producer Surplus

• Useful for discussing implications of **tariffs** and **quotas**

- Useful for discussing implications of tariffs and quotas
- CS and PS determined by market prices and quantities

Consumer and Producer Surplus

- Useful for discussing implications of tariffs and quotas
- CS and PS determined by market prices and quantities

How do tariffs influece P and Q?

Consumer and Producer Surplus

- Useful for discussing implications of tariffs and quotas
- CS and PS determined by market prices and quantities

How do tariffs influece P and Q?

 Our demand and supply curves will reflect national production capacitys

Consumer and Producer Surplus

- Useful for discussing implications of tariffs and quotas
- CS and PS determined by market prices and quantities

How do tariffs influece P and Q?

- Our demand and supply curves will reflect national production capacitys
- Equilibrium price is determined by world price

$$p_w < p^*$$

Local supply Q_1 below market demand Q_2

Import amount is Q_2-Q_1

Tariff will upset this balance

- Market experiences a huge increase in CS due to trade, PS falls, but net welfare rises (CS+PS)
- Assume small country, scale of demand cannot affect world price

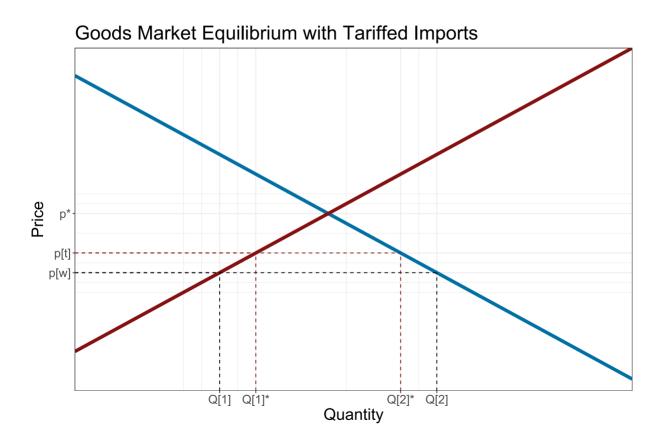

Government imposes tariff amount t, per good imported

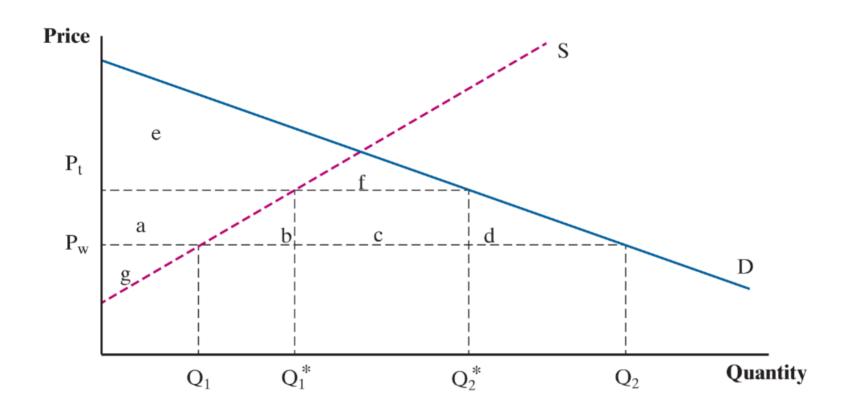

Government imposes tariff amount t, per good imported

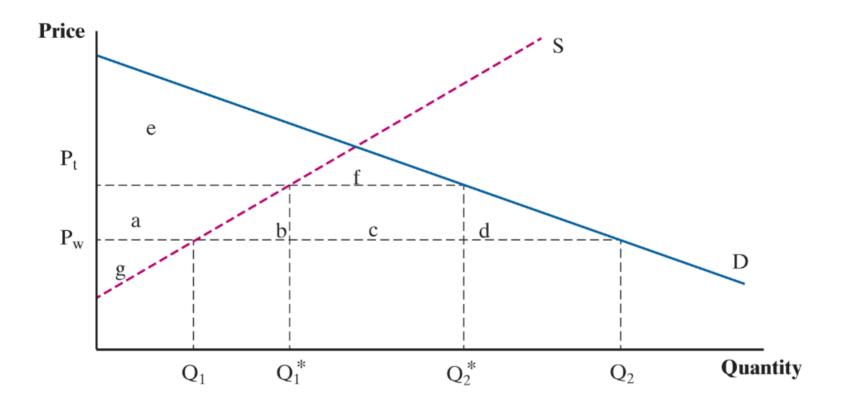

Price updates to $P_t = P_w + t$, all of our outcome variables are affected

Government imposes tariff amount t, per good imported

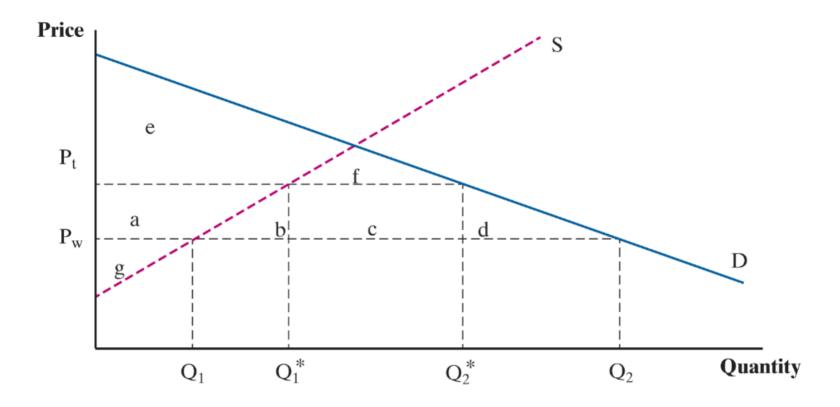

Price updates to $P_t = P_w + t$, all of our outcome variables are affected

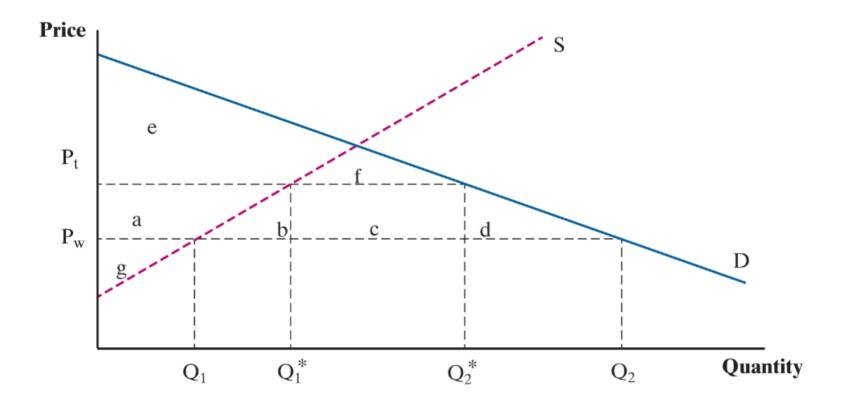

CS under **free trade**, where $t=0: \ a+b+c+d+e+f$

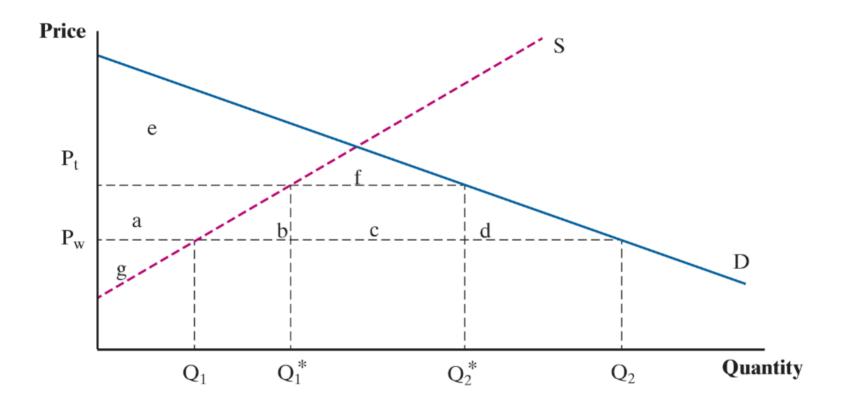

CS under **tariff**, where $t=10:\ e+f$

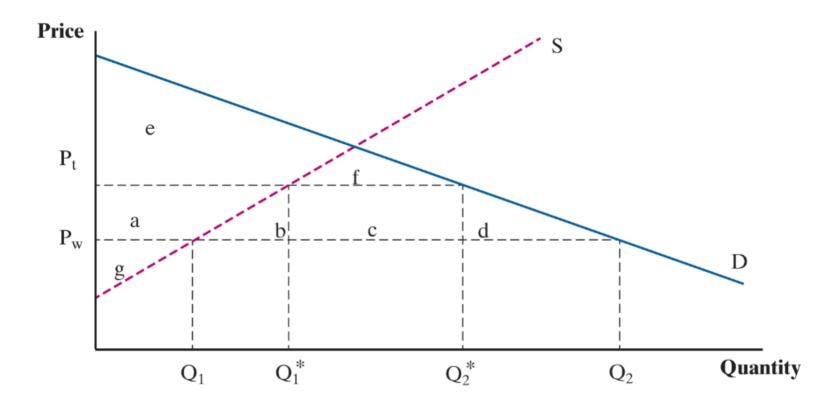

CS under **tariff**, where $t=10:\ e+f$

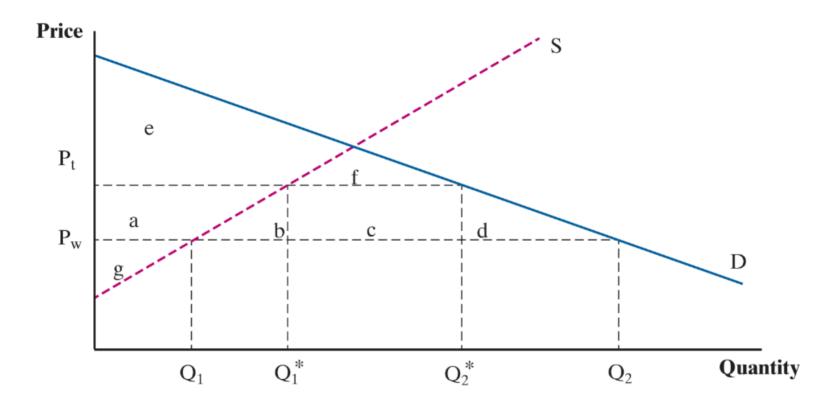

$$\Delta CS = -(a+b+c+d)$$

PS under **free trade**, where $t=0:\ g$

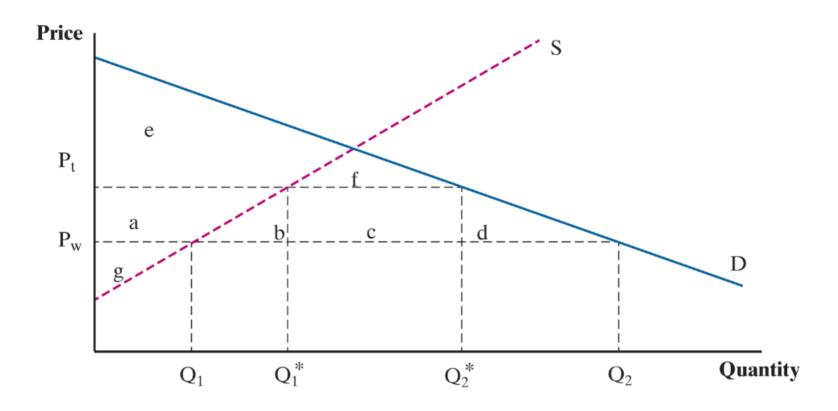

PS under **tariff**, where $t=10:\ g+a$

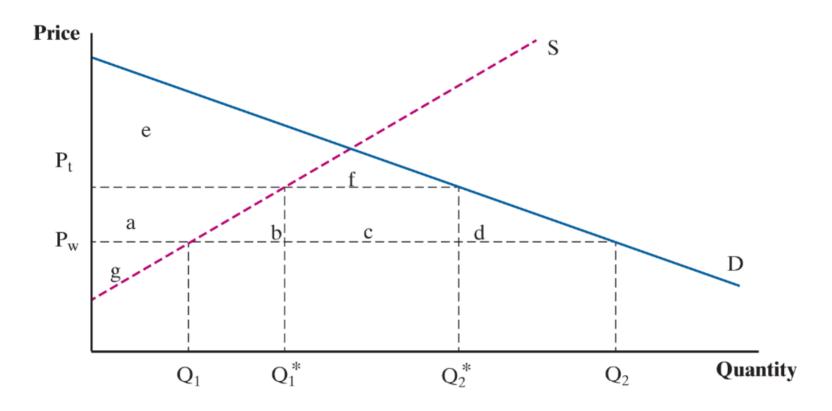

PS under **tariff**, where $t=10:\ g+a$

 $\Delta PS = a$ transferred from consumers to producers

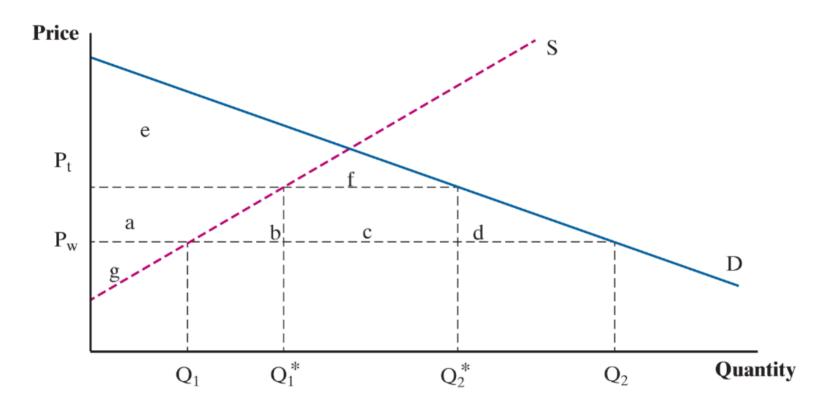

Government collects revenue t times the number of imports

Government collects revenue t times the number of imports

$$c=t imes [Q_2^*-Q_1^*]$$
 transferred from consumers to govt

Consumers lost a+b+c+d, other parties gained $a \ \& \ c$ Societal net loss of b+d where d is deadweight loss and b is efficiency loss

Deadweight loss

Loss associated with the economic welfare consumers that otherwise would have purchased in this market would have generated, had there been no government interference.

Deadweight loss

Loss associated with the economic welfare consumers that otherwise would have purchased in this market would have generated, had there been no government interference.

$$d=rac{1}{2}\Delta P imes \Delta Q_2$$
, where Q_2 represents quantity demanded

Deadweight loss

Loss associated with the economic welfare consumers that otherwise would have purchased in this market would have generated, had there been no government interference.

$$d=rac{1}{2}\Delta P imes \Delta Q_2$$
 , where Q_2 represents quantity demanded

Efficiency loss

Loss associated with producing additional goods at an excessive cost, relatively to how much it would have cost the rest of the world to generate these goods.

Deadweight loss

Loss associated with the economic welfare consumers that otherwise would have purchased in this market would have generated, had there been no government interference.

$$d=rac{1}{2}\Delta P imes \Delta Q_2$$
 , where Q_2 represents quantity demanded

Efficiency loss

Loss associated with producing additional goods at an excessive cost, relatively to how much it would have cost the rest of the world to generate these goods.

$$b=rac{1}{2}\Delta P imes \Delta Q_1$$
, where Q_1 represents quantity supplied

These equilibria we consider do not take into account:

These equilibria we consider do not take into account:

• Retaliatory tariffs (e.g. China Trade War)

These equilibria we consider do not take into account:

- Retaliatory tariffs (e.g. China Trade War)
- Innovation and productivity (less competition)

These equilibria we consider do not take into account:

- Retaliatory tariffs (e.g. China Trade War)
- Innovation and productivity (less competition)
- Import/Export interdependencies within country

Tariff Analysis

These equilibria we consider do not take into account:

- Retaliatory tariffs (e.g. China Trade War)
- Innovation and productivity (less competition)
- Import/Export interdependencies within country
- Rent seeking behaviour (lobbying)

Possible to improve national welfare with tariff as long as no retaliation

Possible to improve national welfare with tariff as long as no retaliation

 Tariff adjustment triggers price reduction by exporter country (rest of world)

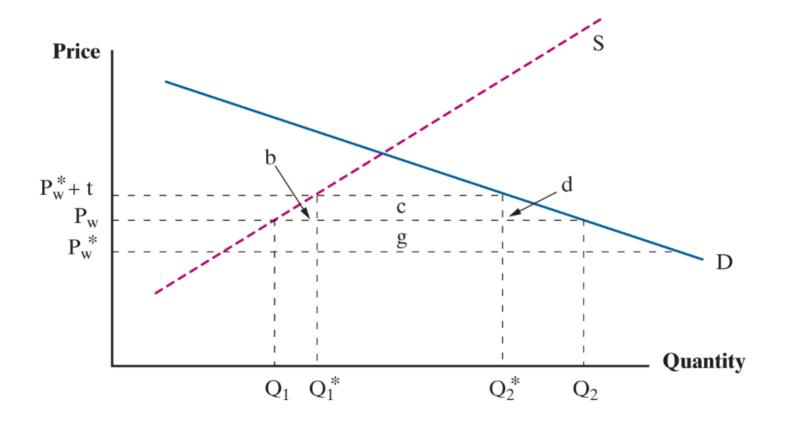

Possible to improve national welfare with tariff as long as no retaliation

- Tariff adjustment triggers price reduction by exporter country (rest of world)
- ullet Fall in Home country demand lowers P_w to $P_w^*.$ Home price becomes $P_t^*=P_w^*+t$

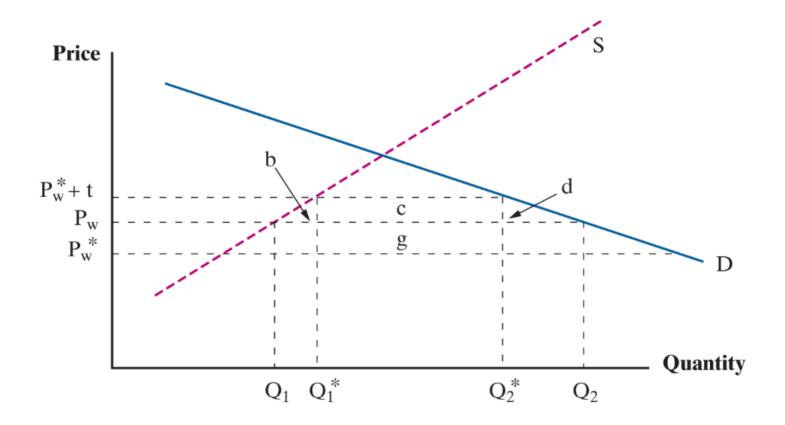

Possible to improve national welfare with tariff as long as no retaliation

- Tariff adjustment triggers price reduction by exporter country (rest of world)
- ullet Fall in Home country demand lowers P_w to $P_w^*.$ Home price becomes $P_t^*=P_w^*+t$
- Price reduction offsets some of the deadweight loss caused by tariff introduction

What happens to overall economic welfare following tariff introduction?

Lower price implies areas b and d are smaller and domestic production grows by a lower scale. If g > b + d then tariff was **welfare enhancing**.

Key Topics

- Use market theory to explain effects of tariffs on market outcomes
- Compare tariff data on inputs and outputs to compare effective and nominal protection levels
- Comparing the **impact of quotas** relative to tariff rate adjustments
- Highlight forms of protection difficult to observe
- New unconventional methods of protectionism

While tariffs protect one industry, they may also inconvenience other domestic industries reliant on imported inputs of intermediate goods

 US tariffs on steel products protected steel industry and hurt car industry

While tariffs protect one industry, they may also inconvenience other domestic industries reliant on imported inputs of intermediate goods

 US tariffs on steel products protected steel industry and hurt car industry

Nominal rate of protection: The amount of a tariff expressed as a percentage of a good's price. This is the tariff we have discussed so far.

While tariffs protect one industry, they may also inconvenience other domestic industries reliant on imported inputs of intermediate goods

 US tariffs on steel products protected steel industry and hurt car industry

Nominal rate of protection: The amount of a tariff expressed as a percentage of a good's price. This is the tariff we have discussed so far.

Effective rate of protection: Level of protection on intermediate inputs and nominal tariff levied on protected good. Measured as percentage change in domestic value added after tariffs on intermediate and final goods applied.

Value-added: Contribution of domestic production factors (capital and labor) to a given product/good.

Value-added: Contribution of domestic production factors (capital and labor) to a given product/good.

Effective Rate of Protecton =
$$(VA^* - VA)/VA$$

Value-added: Contribution of domestic production factors (capital and labor) to a given product/good.

Effective Rate of Protecton =
$$(VA^* - VA)/VA$$

- VA is domestic value-added under free trade
- ullet VA^* is VA after accounting for all relevant tariffs

Suppose we introduce **two tariffs** in sequence

Variable	No Tariff	40% Tariff, Final Good	+10% Tariff, Intrm. Good
Domestic Price of Good, VA*	5000	7000.0	7000.0
Value of Imported Input	400	400.0	440.0
Domestic Value-Added, VA	4600	6600.0	6560.0
Effective RP, %	0	43.5	42.6

Sufficiently high import reliance can make tariff protection yield **negative protection measure**, depending on the good examined.

Sufficiently high import reliance can make tariff protection yield **negative protection measure**, depending on the good examined.

Upcoming homework expects you to yield examples of such outcomes.

To summarise:

- Tariffs are bad for countries with little influence on world prices
- Large countries exhibit an ambiguous effect
- Tariff protection can backfire, depending on input reliances

To summarise:

- Tariffs are bad for countries with little influence on world prices
- Large countries exhibit an ambiguous effect
- Tariff protection can backfire, depending on input reliances

Next time

Discuss quotas, difficulties in observing protectionism and unconventional methods used
